Exercise 1: Ever Given

1 Ever Given

In March 2021, a container ship *Ever Given* blocked Suez Canal. Consider your are the captain of one of the ships that is waiting for passing through Suez Canal. You want to arrive your destination as soon as possible. However, because of the obstruction, your ship is idle near by Suez Canal and you have no idea when the canal will be available again. You have two options:

- to wait until the canal is available, and you can pass through the canal in F unit of time; or
- to go around Africa via the Cape of Good Hope, and you can arrive your destination in S units of time.

Note that F stands for fast, S stands for slow, and F < S.

Answer the following questions:

- 1. What is an *instance* in this problem?
- 2. What is the *cost* in this problem?
- 3. Consider the following strategy ALG_{S-F} that keeps waiting until the (S-F)-th time unit:

```
Algorithm 1 ALG_{S-F}
```

```
1: t ← the current time
2: while t < S - F do
3: if The canal is available then
4: Pass through the canal
5: else
6: Wait
7: Turn around and take the Cape of Good Hope route
S - F-th unit of time

| S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - F - th unit of time | The S - The Unit of time | The Unit of time |
```

(a) Prove that ALG_{S-F} is $(2 - \frac{F}{S})$ -competitive. (Hint:

- i. Let a be the actual time when the canal is available. How much is the optimal cost when a < S F? How much is the cost of ALG_{S-F} ?
- ii. Let a be the actual time when the canal is available. How much is the optimal cost when $a \ge S F$? How much is the cost of ALG_{S-F} ?
- (b) Show that your analysis is tight.
- 4. Prove that for this problem, there is no deterministic online algorithm better than $(2 \frac{F}{S})$ competitive.

(Hint: Any deterministic online algorithm must turns around to the Cape of Good Hope route at some time T. Show that for any of these algorithms, there is an adversarial instance such that the ratio of the algorithm's cost to the optimal cost is at least $2 - \frac{F}{S}$.)

2 Buy on the $\frac{B}{2}$ -th day

Recall the Ski Rental problem mentioned in the lecture. Now, assume that $B \ge 1$ is even and consider the algorithm $\text{ALG}_{\frac{B}{2}}$ which buys the ski on the $\frac{B}{2}$ -th day. Answer the following questions:

- 1. Prove that ALG_{$\frac{B}{2}$} is at least $(3 \frac{2}{B})$ -competitive.
- 2. Prove that ALG $_{\frac{B}{2}}$ is $(3 \frac{2}{B})$ -competitive.

(Hint:

Consider the case where the number of skiing days $d < \frac{B}{2}$, $d \ge B$, and $\frac{B}{2} \le d < B$. The last case is the most tricky one, where the algorithm buys the ski but the optimal keeps renting the ski. The ratio between the algorithm cost and the optimal cost in this case is $\frac{B}{2}-1+B$. You need to find a good value of d so you can get rid of it from the ratio while still having a valid upper bound.

2
